- vite.config.ts # Vite configuration file

Tech Stack

Vite, TypeScript, React, Supabase

Development Guidelines

How to edit code locally?

You can choose [VSCode](#) or any IDE you prefer. The only requirement is to have Node.js and npm installed.

Environment Requirements

Node.js ≥ 20

npm ≥ 10

Example:

```
# node -v    # v20.18.3
# npm -v     # 10.8.2
```

Installing Node.js on Windows

Step 1: Visit the Node.js official website: <https://nodejs.org/>, click download. The website will automatically suggest a suitable version (32-bit or 64-bit) for your system.

Step 2: Run the installer: Double-click the downloaded installer to run it.

Step 3: Complete the installation: Follow the installation wizard to complete the process.

Step 4: Verify installation: Open Command Prompt (cmd) or your IDE terminal, and type `node -v`` and `npm -v`` to check if Node.js and npm are installed correctly.

Installing Node.js on macOS

Step 1: Using Homebrew (Recommended method): Open Terminal. Type the command ``brew install node`` and press Enter. If Homebrew is not installed, you need to install it first by running the following command in Terminal:
`/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"`
Alternatively, use the official installer: Visit the Node.js official website. Download the macOS .pkg installer. Open the downloaded .pkg file and follow the prompts to complete the installation.

Step 2: Verify installation: Open Command Prompt (cmd) or your IDE terminal, and type ``node -v`` and ``npm -v`` to check if Node.js and npm are installed correctly.

After installation, follow these steps:

Step 1: Download the code package

Step 2: Extract the code package

Step 3: Open the code package with your IDE and navigate into the code directory

Step 4: In the IDE terminal, run the command to install dependencies: `npm i`

Step 5: In the IDE terminal, run the command to start the development server: `npm run dev -- --host 127.0.0.1`

Step 6: if step 5 failed, try this command to start the development server: `npx vite --host 127.0.0.1`

How to develop backend services?

Configure environment variables and install relevant dependencies. If you need to use a database, please use the official version of Supabase.
